## Abstract

An inclusive search for supersymmetric processes that produce final states with jets and missing transverse energy is performed in pp collisions at a centre-of-mass energy of  $\sqrt{s} = 8$  TeV. The data sample corresponds to an integrated luminosity of  $18.5 \text{ fb}^{-1}$  collected by the CMS experiment at the LHC. In this search, a dimensionless kinematic variable,  $\alpha_T$ , is used to discriminate between events with genuine and misreconstructed missing transverse energy. The search is based on an examination of the number of reconstructed jets per event, the scalar sum of transverse energies of these jets, and the number of these jets identified as originating from bottom quarks. The results are interpreted with various simplified models, with a special emphasis on models with a compressed mass spectrum.

## 0.1 Theoretical motivation

SM,Higgs,SUSY

Particle physics concerns itself with the study of particles and fields. Our current knowledge of their characteristics and interactions are formalized in the quantum field theory called the Standard Model. It through three symmetries: The color charge symmetry of Quantum Chromo Dynamics (QCD) represented in  $SU(3)$ , the flavor symmetry of Quantum Flavor Dynamics (QFD) represented in  $SU(2)$  and the electric charge symmetry of Quantum Electro Dynamics represented in  $U(1)$ . Together,  $SU(3) \times SU(2) \times U(1)$  represent the field theory.

### **0.6.6 Single isolated tracks**

## 0.7 Event selection

### 0.7.1 Event vetoes for leptons, photons, and single isolated tracks

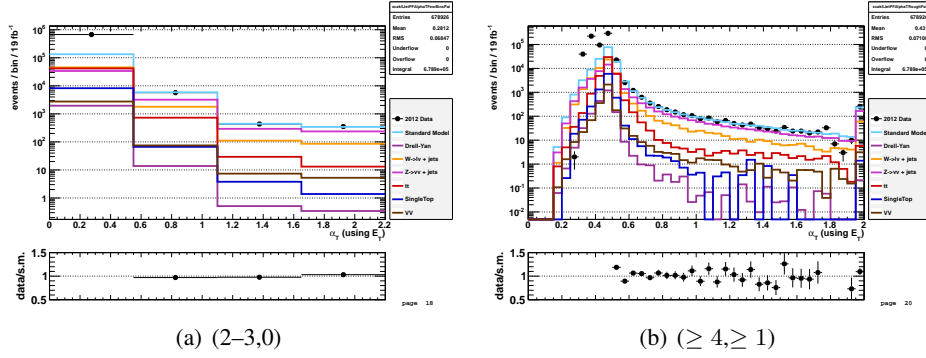

Figure 2: Data–MC comparison of the  $\alpha_T$  distribution for the hadronic signal region, following the application of the hadronic pre-selection criteria and the requirements  $H_T > 375$  GeV and  $\alpha_T > 0.55$ , for events satisfying (Left)  $2 \leq n_{\text{jet}} \leq 3$  and  $n_b = 0$  and (Right)  $n_{\text{jet}} \geq 4$  and  $n_b \geq 1$ . Bands represent the uncertainties due to the limited size of MC samples.

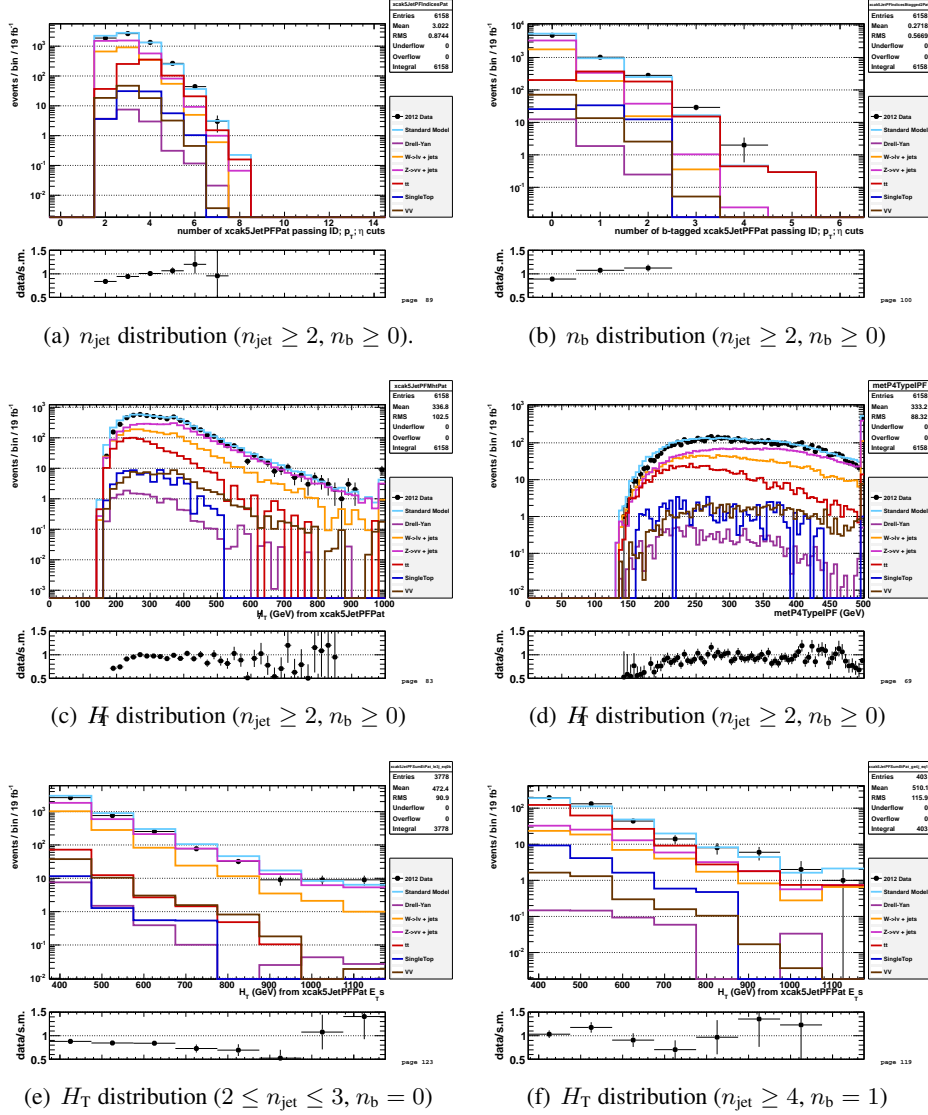

Figure 3: Data–MC comparisons of key variables for the hadronic signal region, following the application of the full signal region selection criteria and the requirements  $H_{\text{T}} > 375 \text{ GeV}$  and  $\alpha_{\text{T}} > 0.55$ : (a)  $n_{\text{jet}}$ , (b)  $n_b$ , (c)  $H_{\text{T}}$ , and (d)  $E_{\text{T}}$  distributions for an inclusive selection on  $n_{\text{jet}}$  and  $n_b$ , and (e,f)  $H_{\text{T}}$  for the two event categories ( $2 \leq n_{\text{jet}} \leq 3, n_b = 0$ ) and ( $n_{\text{jet}} \geq 4, n_b = 1$ ).

## 0.8 Closure tests and systematic uncertainties on transfer factors

Since the transfer factors are obtained from simulation, an appropriate systematic uncertainty is assigned to each factor to account for theoretical uncertainties [?] and limitations in the simulation modelling of event kinematics and instrumental effects. This section describes how the systematic uncertainties are determined from closure tests in data.

### 0.8.1 Closure tests

Table 1:  $2 \leq n_{\text{jet}} \leq 3$  bin.

Closure test	Symbol	Constant fit			
		Best fit value	$\chi^2$	d.o.f.	$p$ -value
$\alpha_T < 0.55 \rightarrow \alpha_T > 0.55$ ( $\mu$ + jets)	Circle	$0.007 \pm 0.02$	3.91	7	0.79
$2 \leq n_{\text{jet}} \leq 3 \rightarrow n_{\text{jet}} \geq 4$ ( $\mu$ + jets, 1 b-tags)	Times	$-0.053 \pm 0.03$	8.02	7	0.33
$2 \leq n_{\text{jet}} \leq 3 \rightarrow n_{\text{jet}} \geq 4$ ( $\mu$ + jets, 1 b-tags)	Invert. Triangle	$0.018 \pm 0.04$	6.23	7	0.51
$2 \leq n_{\text{jet}} \leq 3 \rightarrow n_{\text{jet}} \geq 4$ ( $\mu$ + jets, 0 b-tags)	Star	$0.034 \pm 0.02$	9.24	7	0.24
$2 \leq n_{\text{jet}} \leq 3 \rightarrow n_{\text{jet}} \geq 4$ ( $\gamma$ + jets, 0 b-tags)	Diamond	$0.100 \pm 0.04$	12.20	7	0.09
1 b-tags $\rightarrow$ 2 b-tags ( $\mu$ + jets, nJet=3)	Triangle	$-0.008 \pm 0.04$	3.20	7	0.87
0 b-tags $\rightarrow$ 1 b-tags ( $\mu$ + jets, nJet=2)	Cross	$0.111 \pm 0.03$	5.87	7	0.55
0 b-tags $\rightarrow$ 1 b-tags ( $\mu$ + jets, nJet=3)	Square	$0.040 \pm 0.02$	1.12	7	0.99

Table 2:  $n_{\text{jet}} \geq 4$  bin.

Closure test	Symbol	Constant fit			
		Best fit value	$\chi^2$	d.o.f.	$p$ -value
$\alpha_T < 0.55 \rightarrow \alpha_T > 0.55$ ( $\mu$ + jets)	Circle	$0.011 \pm 0.04$	5.81	7	0.56
$2 \leq n_{\text{jet}} \leq 3 \rightarrow n_{\text{jet}} \geq 4$ ( $\mu$ + jets, 1 b-tags)	Times	$-0.053 \pm 0.03$	8.02	7	0.33
$2 \leq n_{\text{jet}} \leq 3 \rightarrow n_{\text{jet}} \geq 4$ ( $\mu$ + jets, 1 b-tags)	Invert. Triangle	$0.018 \pm 0.04$	6.23	7	0.51
$2 \leq n_{\text{jet}} \leq 3 \rightarrow n_{\text{jet}} \geq 4$ ( $\mu$ + jets, 0 b-tags)	Star	$0.034 \pm 0.02$	9.24	7	0.24

1 b-tags $\rightarrow$ 2 b-tags ( $\mu$ + jets)	Triangle	$0.045 \pm 0.03$	9.36	7	0.23
0 b-tags $\rightarrow$ 1 b-tags ( $\mu$ + jets)	Square	$0.007 \pm 0.03$	25.30	7	0.00

(a)  $2 \leq n_{\text{jet}} \leq 3$ (b)  $n_{\text{jet}} \geq 4$ 

Figure 4: Sets of closure tests (open symbols) overlaid on top of the systematic uncertainty used for each of the five  $H_T$  regions (shaded bands) and for the two different jet multiplicity bins: (a)  $2 \leq n_{\text{jet}} \leq 3$  and (b)  $n_{\text{jet}} \geq 4$ .

## **0.9 Results**

### **0.9.1 Standard Model**

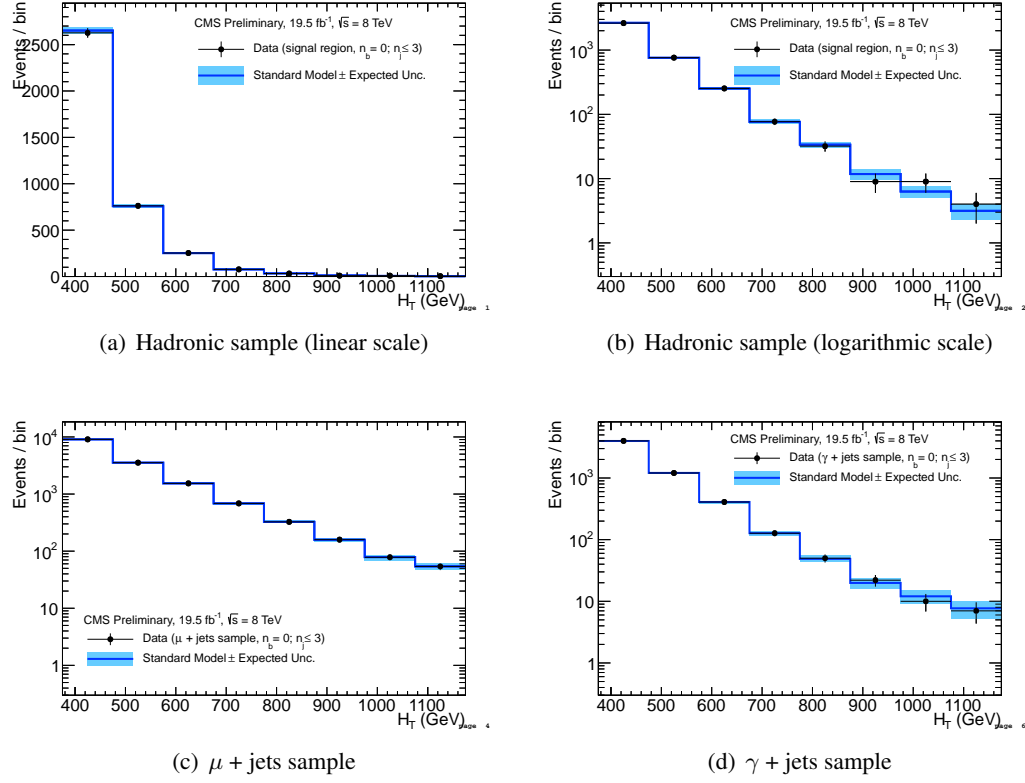

Figure 5: Comparison of the  $H_T$ -binned observed data yields and SM expectations when requiring  $2 \leq n_{\text{jet}} \leq 3$  and  $n_b = 0$  for the (a-b) hadronic, (c)  $\mu + \text{jets}$ , (d)  $\mu\mu + \text{jets}$  and (e)  $\gamma + \text{jets}$  samples, as determined by a simultaneous fit to all data samples under the SM-only hypothesis. The observed event yields in data (black dots) and the expectations and their uncertainties (dark blue solid line with light blue bands), as determined by the simultaneous fit, are shown. For illustrative purposes only, the signal expectations (pink dashed line) for the model T2cc with  $m_{\tilde{q}} = 250$  GeV and  $m_{\text{LSP}} = 240$  GeV are stacked on top of the SM expectations.

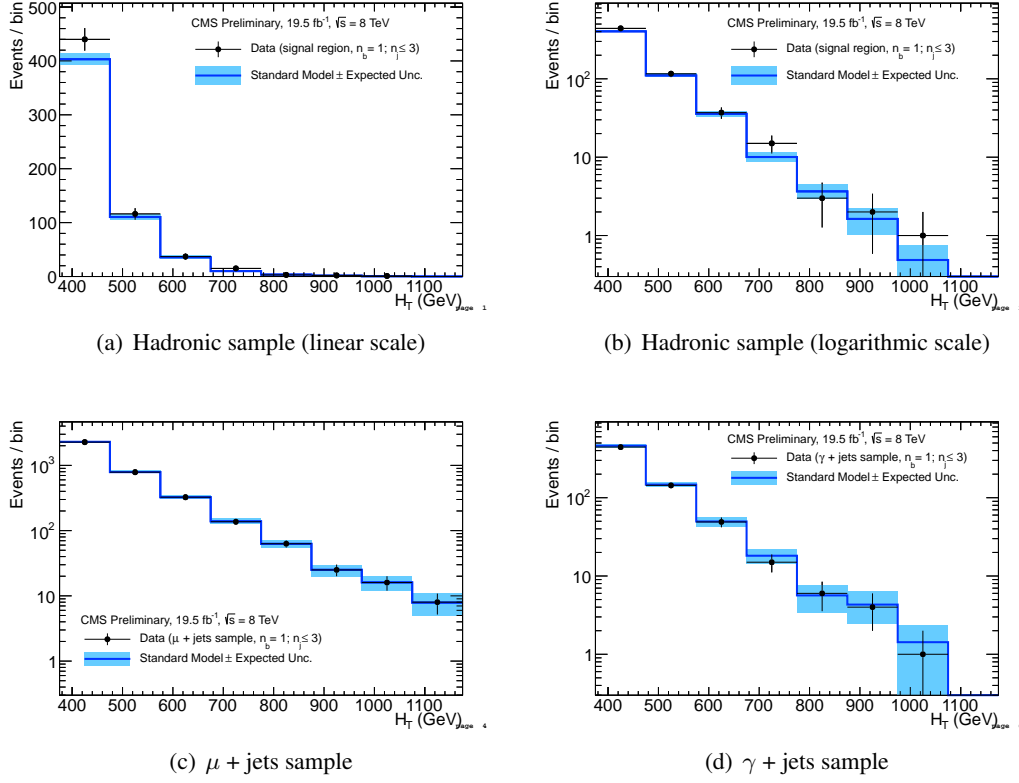

Figure 6: Comparison of the  $H_T$ -binned observed data yields and SM expectations when requiring  $2 \leq n_{\text{jet}} \leq 3$  and  $n_b = 1$  for the (a-b) hadronic, (c)  $\mu$  + jets, (d)  $\mu\mu$  + jets and (e)  $\gamma$  + jets samples, as determined by a simultaneous fit to all data samples under the SM-only hypothesis. The observed event yields in data (black dots) and the expectations and their uncertainties (dark blue solid line with light blue bands), as determined by the simultaneous fit, are shown. For illustrative purposes only, the signal expectations (pink dashed line) for the model T2cc with  $m_{\tilde{q}} = 250$  GeV and  $m_{\text{LSP}} = 170$  GeV are stacked on top of the SM expectations.

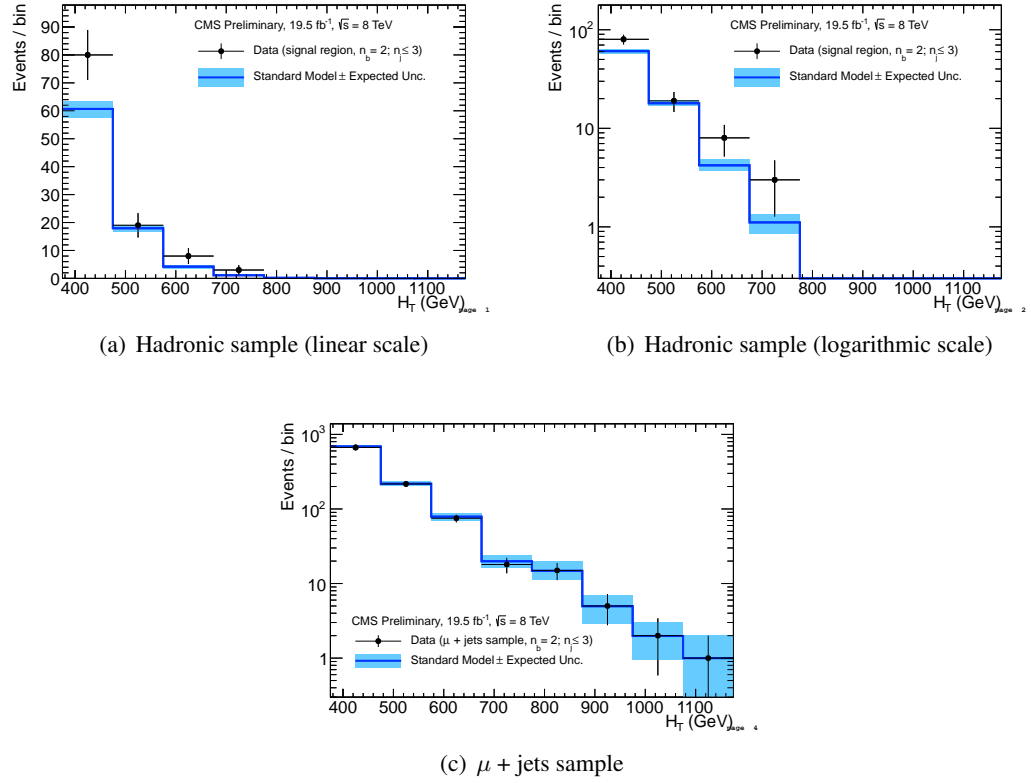

Figure 7: Comparison of the  $H_T$ -binned observed data yields and SM expectations when requiring  $2 \leq n_{jet} \leq 3$  and  $n_b = 2$  for the (a-b) hadronic and  $\mu$  + jets samples, as determined by a simultaneous fit to both the hadronic and  $\mu$  + jets data samples under the SM-only hypothesis. The observed event yields in data (black dots) and the expectations and their uncertainties (dark blue solid line with light blue bands), as determined by the simultaneous fit, are shown.

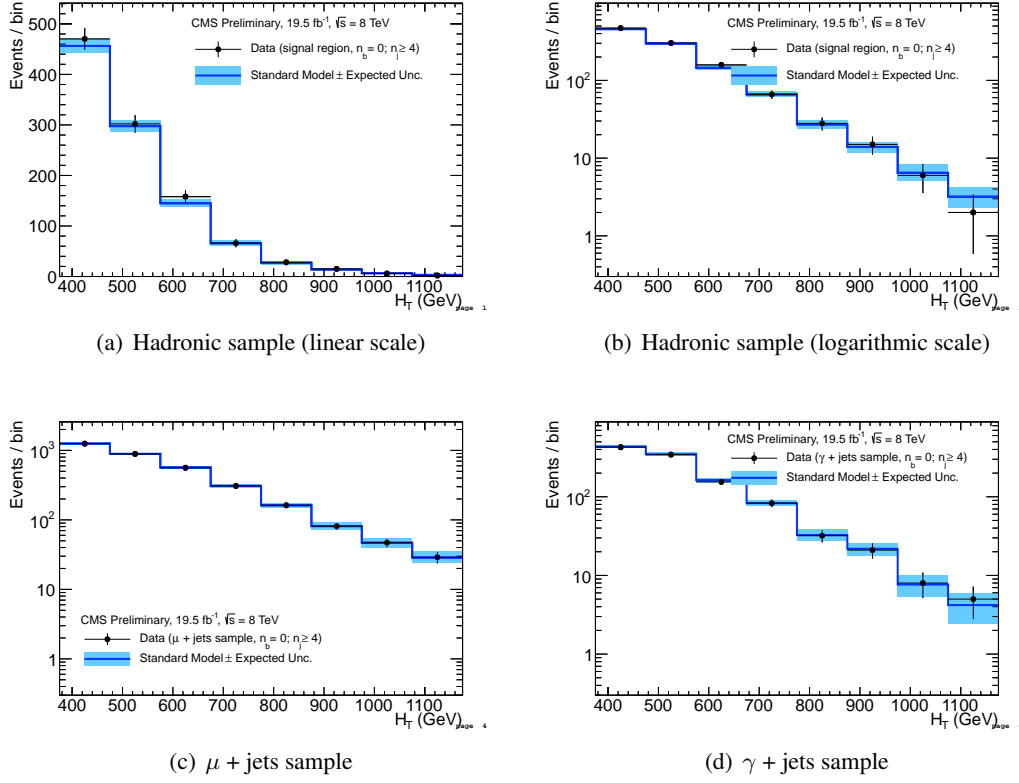

Figure 8: Comparison of the  $H_T$ -binned observed data yields and SM expectations when requiring  $n_{\text{jet}} \geq 4$  and  $n_b = 0$  for the (a-b) hadronic, (c)  $\mu$  + jets, (d)  $\mu\mu$  + jets and (e)  $\gamma$  + jets samples, as determined by a simultaneous fit to all data samples under the SM-only hypothesis. The observed event yields in data (black dots) and the expectations and their uncertainties (dark blue solid line with light blue bands), as determined by the simultaneous fit, are shown. For illustrative purposes only, the signal expectations (pink dashed line) for the model T2cc with  $m_{\tilde{q}} = 250$  GeV and  $m_{\text{LSP}} = 170$  GeV are stacked on top of the SM expectations.

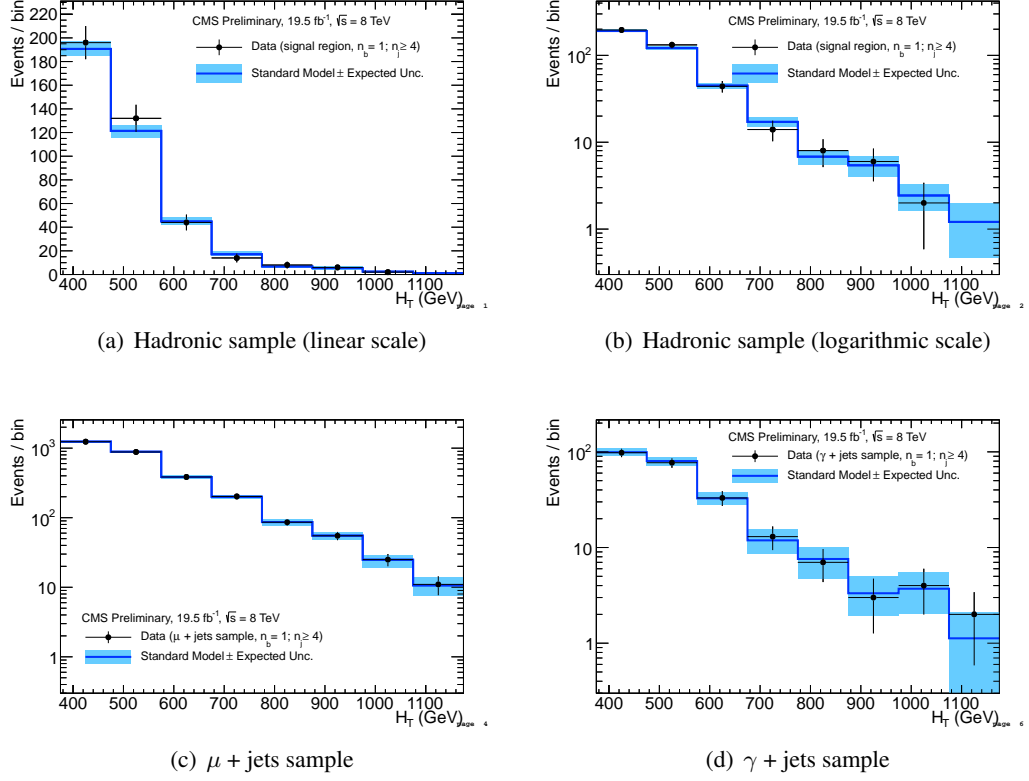

Figure 9: Comparison of the  $H_T$ -binned observed data yields and SM expectations when requiring  $n_{\text{jet}} \geq 4$  and  $n_b = 1$  for the (a-b) hadronic, (c)  $\mu + \text{jets}$ , (d)  $\mu\mu + \text{jets}$  and (e)  $\gamma + \text{jets}$  samples, as determined by a simultaneous fit to all data samples under the SM-only hypothesis. The observed event yields in data (black dots) and the expectations and their uncertainties (dark blue solid line with light blue bands), as determined by the simultaneous fit, are shown. For illustrative purposes only, the signal expectations (pink dashed line) for the model T2cc with  $m_{\tilde{q}} = 250$  GeV and  $m_{\text{LSP}} = 170$  GeV are stacked on top of the SM expectations.

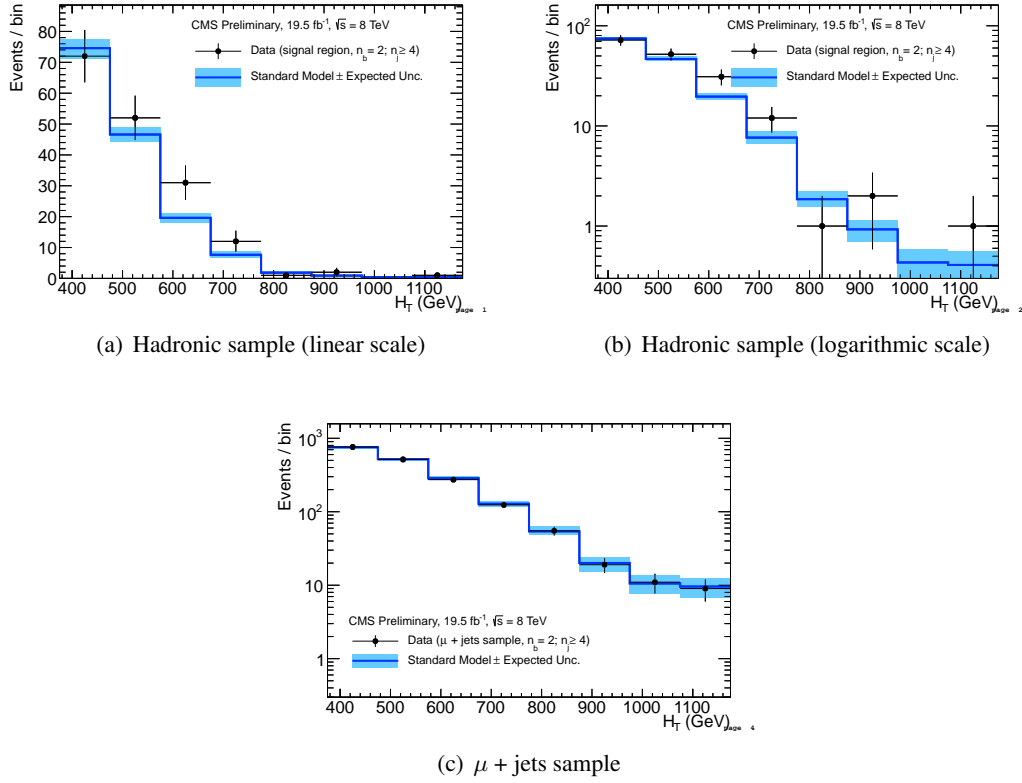

Figure 10: Comparison of the  $H_T$ -binned observed data yields and SM expectations when requiring  $n_{jet} \geq 4$  and  $n_b = 2$  for the (a-b) hadronic and  $\mu$  + jets samples, as determined by a simultaneous fit to both the hadronic and  $\mu$  + jets data samples under the SM-only hypothesis. The observed event yields in data (black dots) and the expectations and their uncertainties (dark blue solid line with light blue bands), as determined by the simultaneous fit, are shown.

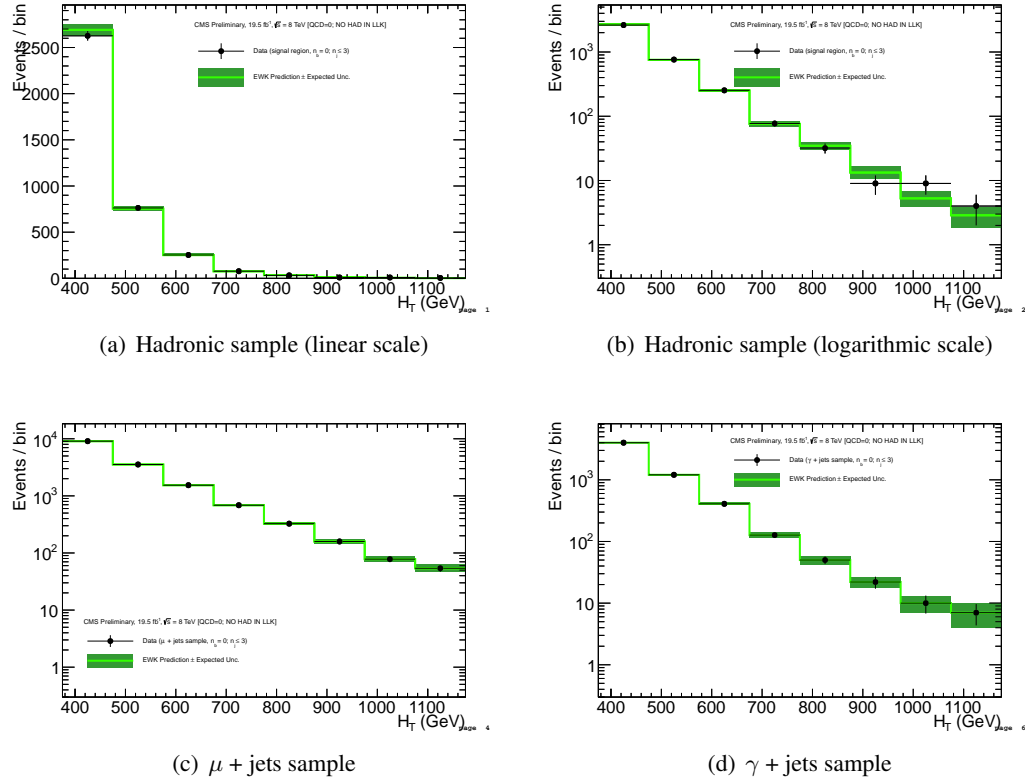

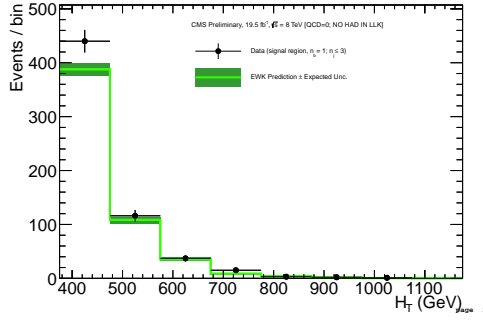

Figure 11: Comparison of the  $H_T$ -binned observed data yields and SM expectations when requiring  $2 \leq n_{jet} \leq 3$  and  $n_b = 0$  for the (a-b) hadronic, (c)  $\mu$  + jets, (d)  $\mu\mu$  + jets and (e)  $\gamma$  + jets samples, as determined by a simultaneous fit to the data control samples only. The observed event yields in data (black dots) and the expectations and their uncertainties (dark green solid line with light green bands), as determined by the simultaneous fit, are shown.
